pipeline

BY THE INSTILLERY

At the heart of digital transformation is an active development pipeline, continually adding, testing and deploying new features. We equip agile teams and leaders with the tools to empower success and ensure the delivery of business outcomes.

Our Pipeline tool and managed service integrates the key components of a CI/CD pipeline, while adding the hygiene required to keep dev teams moving without the overhead of manually keeping all things in check.

Pipeline offers organisations an automated and enhanced software development approach. Reducing development time and resources required, accelerating project releases and in turn ultimately reducing internal and agency costs to decrease business risk.

PROVISIONING AND MANAGEMENT

Create new pipelines in minutes to set up new projects, initiatives or epics. Setup new users roles and vendors and get them working quickly and efficiently.

STANDARDISED CONVENTIONS

While we all enjoy reinventing the wheel from time to time, on scale this becomes impossible to manage. Using the same tools, code segments and templates, allows individuals to move between teams and keeps code supportable.

PIPELINE TOOL CHAIN

With our pluggable architecture we're able to add in the tools or content targets relevant to your business. Adopting the best of breed tools should be painless.

MULTI-TENANTED

Sometimes dev teams need a bit of a boost. Add external vendor to supplement your internal
teams. All supported in Pipeline, as part of the simple management console.

AUTOMATION

Configure all the key components of a CI/CD pipeline effortlessly. Whether it's documentation, code repositories or project boards it's all setup and ready to go.

SELF SERVICE

Pipeline isn't about removing capability from teams, but empowering them. Giving the right people the right access to perform.

BENEFITS

VISIBILITY

Losing track of all the development activity underway? Hit your targets and get time-to-market in check by visualising progress across development projects.

PROCESS CONSISTENCY

Organisations adopting agile often struggle to get the results they are looking for. Make the move to agile development tangible for your people with the tooling and pipeline to support the theory.

COMMUNICATIONS

Team on the same page? If so you're doing well! If not Pipeline will ensure updates are sent to an integrated communication channel for a project, allowing teams to use short-form-comms, but also see updates on project process and events like code pushes.

STANDARDISATION

Creativity is great, but when applied to everything, things tend to get a little chaotic. Standardise the process, and allow creativity to reign free within the project.

EDUCATION

Integrated with a Learning Management System, onboarding users includes full training, allowing everyone to get working and up to speed, at speed.

ACCELERATED TIME-TO-MARKET

In business timing is everything. Getting products or campaigns to market at the right time, everytime matters. Build certainty into your releases and grow business confidence by getting the levers you need.

> **You could not hope for a more engaged partner. Not just from the initial discovery piece of our current state of play, but also where the final destination should be on that journey and all throughout the process. They didn't just deal with us as a partner, they took all of our vendors on that journey. It is absolutely invaluable, saving us millions in the process.**
